STEPS 1-3

Research, Problem Framing & Product Direction

Fireflies.ai Commitment Closure

Research objective: Understand what happens to a commitment after a meeting ends.

Baseline: 28% of extracted commitments reach explicit resolution within 14 days.

Six-month target: Increase 14-day commitment resolution to 45%.

Resolution definition: Done, reassigned to a different owner, or deliberately dropped.

> **Research focus**
> The goal is honest closure, not pressure to mark every commitment complete. The research traces commitments from extraction and visibility through ownership, tracking and final outcome.

Evidence snapshot

- Direct hands-on teardown of Fireflies and its Asana integration.
- Secondary manager research from project-management guidance and practitioner discussions.
- Comparative analysis of project tools, chat, standups, email and personal systems.

1. Research Questions and Hypotheses

The questions follow one recent commitment from the meeting to its eventual resolution or abandonment.

#	Research question	Initial hypothesis	Status
1	Where does an extracted commitment appear immediately after a meeting?	Most commitments remain in a meeting summary rather than entering a structured work system.	Directionally supported
2	How is responsibility for the commitment established and preserved?	Fireflies may establish ownership correctly, but that ownership can be lost as structured metadata during external handoff.	Confirmed in teardown
3	Where is the commitment tracked after extraction?	Tracking is fragmented across summaries, chat, calendars and personal systems.	Supported
4	Who monitors follow-through?	Managers frequently become responsible for checking status.	Directionally supported
5	What happens to the commitment within 14 days?	Competing priorities cause some commitments to be silently ignored.	Supported
6	Is the final outcome reflected in the meeting assistant?	Work resolved externally may continue appearing unresolved in Fireflies.	Confirmed in teardown
7	What would most improve explicit closure?	A complete external handoff and reliable status tracking matter more than additional reminders.	Directionally supported

2. Research Plan

A mixed-method plan was used to combine behavioral evidence, direct product observation and secondary stakeholder research.

Stakeholder group	Target	Research objective
Commitment makers	8 planned	Understand ownership, tracking and personal follow-through
People depending on commitments	5 planned	Understand visibility and follow-up burden
Administrators / tool buyers	2 planned	Understand integrations, governance, adoption and value

Methods

Method	Purpose	Status
Fireflies product teardown	Current post-meeting experience	Completed
Fireflies-Asana test	Handoff and closure synchronization	Completed
Reddit social listening	Recurring follow-through problems	Completed

Method	Purpose	Status
Secondary manager research	Management tracking practices	Completed
Competitive workflow analysis	Alternative tracking approaches	Completed

3. Evidence of User Interactions

Evidence	Stakeholder	Channel	Observation
TD-01	Researcher / evaluator	Direct Fireflies use	Product captures, distributes and displays meeting action items
TD-02	Researcher / evaluator	Fireflies-Asana test	Commitment content transfers, but execution metadata and external status do not
SEC-01	Managers / PMs	Secondary research	Common practices include owner confirmation, task tools and recurring review

4. Product Teardown

The teardown covered the post-meeting email, Meetings and Tasks areas, AskFred, Personal Assistant and a direct Asana integration test.

Stage	Current Fireflies capability	Value
Post-meeting processing	Generates transcript, notes, summary and action items	Reduces manual capture
Distribution	Sends follow-up email to participants	Creates immediate awareness
Meeting history	Stores transcripts and notes in Meetings	Preserves source context
Cross-meeting retrieval	AskFred retrieves information across meetings	Supports on-demand discovery
Personal overview	Personal Assistant provides Daily Digest and topics	Consolidates recent activity

Stage	Current Fireflies capability	Value
Task management	Tasks can be viewed and managed inside Fireflies	Adds a structured in-product surface
External integrations	Connects to Asana, Jira, Trello and others	Routes work into existing systems

Fireflies-Asana integration test

Initial setup was straightforward: connect Asana, select a workspace and project, choose which Fireflies tasks to send, and complete the push. Manual selection provides useful consent and prevents every extracted item from automatically entering the project board.

Test	Observed result	Implication
Owner in Fireflies	Task is assigned to the person who claimed it	Ownership exists before handoff

Test	Observed result	Implication
Manual push	User chooses My Tasks, All Tasks or selected tasks	Useful consent gate; avoids automatic clutter
Task content	Commitment information appears in the Asana ticket	Discussion intent is preserved
Execution metadata	Asana ticket has no assignee, due date or timeline	Approved task is not execution-ready
Complete in Asana	Fireflies remains unchanged	Completed work can appear unresolved
Reassign in Asana	Fireflies retains prior ownership/status	Ownership becomes stale

Test	Observed result	Implication
Delete in Asana	Fireflies remains unchanged	No deliberate-drop record

Primary teardown insight

Fireflies preserves user consent and the commitment content during export, but not the structured execution state. The approved Asana ticket arrives without an assignee, due date or timeline, while completion, reassignment and deletion do not return to Fireflies. The result is an operationally incomplete outbound task and a stale inbound status.

5. Stakeholder Map

Stakeholder	Primary job	Current pain	Need from Fireflies
Commitment maker	Execute in the preferred tool and update once	Re-entering assignee/timing; duplicate status	Complete metadata handoff and external sync
Manager	Know whether commitments reached an outcome	Manual chasing and stale meeting prep	Exception-based visibility without rankings
Dependent teammate	Know when upstream work enables their task	Must ask for owner, timing and outcome	Relevant dependency-state changes only

Stakeholder	Primary job	Current pain	Need from Fireflies
Administrator	Configure reliable workflows	Repeated routing and integration upkeep	Reusable rules, controls and reliable synchronization
Buyer	See measurable productivity value	Cannot separate missed work from stale tracking	Aggregate closure and follow-up-effort improvement
Meeting organizer	Turn discussion into accountable action	Structured ownership can be lost at handoff	Preserved owner, context and lifecycle

Manager perspective from secondary research

- Capture an owner and due date while the commitment is being discussed.
- Confirm that the proposed owner understands and accepts the commitment.
- Maintain one visible action list or project system rather than scattered notes.
- Review unresolved items in recurring meetings and ask owners for updates.
- Filter attention by owner, due date and status without turning the system into employee surveillance.

6. Competitive and Alternative Workflow Analysis

Approach	How commitments are tracked	Why it succeeds	Why it fails
AI meeting assistants	Automatic extraction into summaries or task views	Low capture effort	Ownership and downstream closure may remain unclear
Asana / Jira / Trello / Linear	Structured tasks with owners and status	Strong execution and status management	Meeting handoff can be manual; context may separate
Slack / Microsoft Teams	Messages, channels, threads and DMs	Fast and familiar	Items become buried and lack a durable lifecycle
Standups / status meetings	Verbal progress and blocker review	Rich context and real-time decisions	Consumes meeting time; outcomes may not be recorded

Approach	How commitments are tracked	Why it succeeds	Why it fails
Email summaries	Written distribution after meetings	Searchable record	Broadcast does not ensure acceptance or current status
Calendars / reminders	Personal time-based prompts	Simple individual visibility	Weak shared visibility and reassignment
Personal notes / to-do lists	Individual capture in preferred system	Low friction and private	Dependents cannot observe closure
Shared action logs	Owner, date and status in a spreadsheet	Flexible and accessible	Manual maintenance creates stale records

Market opportunity

Different tools handle separate parts of the lifecycle: meeting assistants extract, chat and email distribute, project tools execute, and standups provide context. The opportunity is to connect these stages so the outcome remains observable without duplicating task management.

7. Top Anticipated Barriers

Rank	Barrier	Evidence	Effect on closure
1	Competing business priorities	All 4 respondents in the barrier-question subset selected this	Work can lose relevance without being explicitly dropped or rescheduled
2	Operationally incomplete external handoff	Asana ticket preserved content but lacked assignee, due date and timeline	An approved task can remain unowned and unscheduled in the execution tool
3	One-way status synchronization	Asana completion, reassignment and deletion did not update Fireflies	Completed or changed work can continue appearing unresolved
5	Different commitment types	The Dynatrace monitoring example is conditional and ongoing	A normal task lifecycle can create stale items, spam and unfair 14-day failure

Step 1 synthesis

- Fireflies already extracts tasks, assigns them to the person who claimed ownership and provides My Tasks and All Tasks views.
- Manual external push is a valuable consent mechanism and should not automatically be treated as product failure.
- The strongest observed gap begins after consent: the Asana task lacks structured execution metadata and later outcomes do not return.
- Not every commitment belongs in a project tool; ongoing or conditional monitoring work needs a review period rather than repeated reminders.
- Managers need current exception-based visibility in existing Meeting Prep, not an employee surveillance dashboard.

Research conclusion

Fireflies already creates an owned, in-product task and deliberately asks users which tasks should enter an external work system. The principal observed weakness is execution continuity after that choice: commitment content survives, but ownership and timing do not become structured Asana fields, and downstream outcomes do not return to Fireflies.

STEP 2

Frame the Problem

Why extracted commitments fail to reach honest closure

Objective

Identify the Fireflies-specific lifecycle break with the greatest effect on explicit resolution, while separating genuine execution failure from outcomes that Fireflies simply cannot observe.

1. Refined Problem Statement

Fireflies is not merely a broadcast-summary product. It already creates meeting tasks, assigns them to the person who claimed responsibility, displays My Tasks and All Tasks, supports internal task management, offers manual external push, and prepares users for recurring meetings. These strengths narrow the problem to what happens after a user approves an external handoff.

Existing capability	Current Fireflies behavior	Value already delivered
Extraction and ownership	Creates a task and assigns the person who claimed it	Ownership exists inside Fireflies
Role-based visibility	My Tasks and All Tasks	Individuals and authorized teammates can find tasks
Internal controls	Edit, complete, unassign, reassign and delete	Fireflies can manage an internal task state
External routing	User chooses which tasks to push	Consent prevents automatic project-board clutter
Meeting preparation	Earlier discussion points and open actions	Managers can prepare without searching every recap

Refined problem statement

Fireflies preserves the approved commitment content when it is pushed to Asana, but it does not preserve a complete execution state. The external ticket lacks structured assignee and timing fields, while completion, reassignment and deletion do not synchronize back. Fireflies can therefore show a commitment without reliably representing who owns it in the work system, when it is expected, or how it ultimately closed.

Research examples

1. In the direct Fireflies-Asana test, Send My Tasks preserved the commitment text but produced an Asana ticket with no assignee, due date or timeline. The user must operationalize the approved task again.
2. Completing, reassigning or deleting that Asana task did not change Fireflies. A legitimate external outcome could therefore continue appearing open or assigned to the previous person.

2. Commitment Lifecycle and Loss Points

Stage	Current behavior	Loss point	Worst case
1. Spoken	Participant claims a commitment	Ambiguous or conditional wording	Incorrect task or no clear review point
2. Extracted	Fireflies creates and assigns the task	Task type may be treated uniformly	Ongoing monitoring looks like a one-time task
3. Reviewed	Owner sees it in My Tasks	Task competes with other work	Priority changes without explicit closure
4. Push decision	User chooses whether and where to send it	Repeated consent adds a small action	Task may remain only in Fireflies; automation could instead create clutter
5. External creation	Commitment content reaches Asana	Assignee, due date and timeline are absent	Ticket is contextually complete but operationally incomplete

Stage	Current behavior	Loss point	Worst case
6. Execution	Work occurs in Asana or another tool	Fireflies is no longer current	Manager and dependent teammate see stale status
7. Outcome	Done, reassigned, deleted or continued externally	Outcome does not return	Tracking failure is mistaken for execution failure
8. Day 14	Fireflies measures explicit closure	Open may mean ignored, ongoing or resolved elsewhere	Resolution metric becomes unreliable

Conditional commitment branch

Example: a team lead agrees to monitor Dynatrace for Amazon S3 file-transfer errors and notify the manager if an error occurs. This is a real commitment, but it is conditional and ongoing rather than a normal deliverable. It may not deserve a Jira or Asana ticket and may have no natural completion date.

- Fireflies cannot claim that monitoring occurred unless the owner or an authorized integration supplies evidence.
- Repeated reminders would create noise when no error occurs.
- Without an agreed review period, correct ongoing work could be counted as unresolved after 14 days.
- The lifecycle needs a review point and an honest outcome such as no issue detected, triggered and reported, continue monitoring, reassigned or stopped.

3. Primary Barrier

Primary barrier
Broken execution continuity: after the user approves an external push, Fireflies preserves what was committed but not the complete structured state needed to execute and observe it across systems.

Observation	Classification	Reason

Why this barrier has the greatest effect

- It explains why a visible commitment can still be unowned and unscheduled in Asana.
- It creates duplicate setup and status work for the person who already accepted the task.
- It leaves managers unable to distinguish ignored work from work completed elsewhere.
- It leaves dependent teammates uncertain about when their blocked work can begin.
- It can depress the 14-day metric through both genuine execution failure and missing observation.

Worst-case challenge to the conclusion

- The tested Asana behavior may depend on the account configuration and may not represent every Fireflies integration.
- Some teams may use Fireflies Tasks as their only source of truth and rarely push tasks externally.
- A due date cannot be transferred when none was explicitly stated or added; Fireflies must never invent one.

- Identity mapping can fail when the Fireflies user and Asana account use different emails or workspace access.
- Two-way synchronization can create conflicts if both systems are edited at the same time.

4. Stakeholder Tension

Core tension
Managers and dependent teammates need trustworthy visibility, while the task owner needs control over destination, priority and follow-up without duplicate administration or constant monitoring.

Persona	What they need	Fair Fireflies role	Worst case
Manager	Current outcomes before follow-up meetings	Exception-based view; fewer status questions	Stale tasks trigger unnecessary chasing or performance judgment
Task owner	Execute once in the preferred tool	Consent, complete handoff and no duplicate updates	Automatic export or reminders create clutter and pressure

Persona	What they need	Fair Fireflies role	Worst case
Dependent teammate	Know when upstream work changes their ability to proceed	Only relevant completion, blocker, reassignment or drop updates	Every task update becomes noise or exposes unrelated work

Where interests diverge

Area	Task owner	Manager / dependent	Balanced principle
Export	Keep manual choice	Track every important commitment	Preserve consent; improve approved handoff
Timing	Control dates based on workload	Know when to expect an outcome	Transfer only explicit or owner-confirmed dates

Area	Task owner	Manager / dependent	Balanced principle
Updates	Update once in Asana	See current status in Fireflies	Synchronize state with clear source-of-truth rules
Dropping	Reprioritize without stigma	Understand why work stopped	Record deliberate drop; do not equate it with failure
Visibility	Autonomy and reasonable privacy	Team-level assurance	Show exceptions and outcomes; never rank individuals
Notifications	Minimal interruption	Timely dependency awareness	Notify only affected people on meaningful state change

Existing manager support and remaining opportunity

Fireflies already offers Meeting Prep with earlier discussion points, decisions and open action items, including a recurring-meeting prep email. This should not be proposed as a net-new feature. The framing opportunity is to make that existing brief trustworthy by reflecting current external outcomes and clearly labeling unavailable or stale status.

5. Business Impact

The six-month goal requires a 17 percentage-point increase from 28% to 45%, equal to approximately 61% relative improvement. For every 1,000 extracted commitments, Fireflies must enable 170 additional explicit outcomes within 14 days.

Value mechanism	How the barrier affects it	Expected business effect
Execution readiness	Preserve assignee and explicit timing after approved push	Fewer unowned or unscheduled external tickets
Outcome observability	Return completion and reassignment from the execution tool	Previously invisible legitimate outcomes become measurable
Honest reprioritization	Distinguish deliberate drop from incorrect-task deletion	Fewer commitments disappear silently
Manager efficiency	Use current status inside existing Meeting Prep	Less manual preparation and status chasing

Value mechanism	How the barrier affects it	Expected business effect
Dependency clarity	Surface only meaningful upstream state changes	Less blocked time without broad notification noise

Value by stakeholder

- Task owner: less duplicate setup, fewer irrelevant reminders and one primary execution workflow.
- Manager: more trustworthy meeting preparation and fewer manual status questions.
- Dependent teammate: faster awareness when an upstream commitment completes, changes or stops.
- Administrator: more useful integrations with fewer inconsistent task records.
- Buyer: measurable reduction in follow-up effort and stronger evidence that meeting intelligence leads to outcomes.

Business risks and measurement safeguards

Worst-case outcome	Business consequence	Safeguard
Automatic export floods project tools	Users disable integrations	Retain consent or narrowly trusted routing rules
Wrong owner or invented date	Loss of product trust	Verify identity; transfer only explicit data
Manager surveillance	Individual contributors resist adoption	Aggregate and exception-based views; no rankings
Easy dropping inflates resolution	45% target improves without healthier behavior	Track reasons, reopen rate and unusual drop patterns
Sync conflicts	Fireflies and Asana show contradictory states	Source-of-truth rules, sync history and conflict state
Reminder overload	Users mute notifications	Measure reminders per task and notification opt-out

Worst-case outcome	Business consequence	Safeguard
Measurement warning A higher displayed resolution rate may reflect better execution, better observation of work already completed elsewhere, or unhealthy pressure to clear tasks. The north-star outcome must later be paired with external sync coverage, execution-ready export rate, drop and reopen rates, reminder volume, notification opt-out and user-reported follow-up effort.		
Step 2 conclusion The strongest Fireflies opportunity is not more task visibility or automatic export. It is to preserve consent while carrying an approved commitment into execution with the correct structured state, then return its honest outcome to the people who depend on it. This can improve the 14-day resolution rate without turning Fireflies into a task manager or employee-monitoring system.		

STEP 3

Solution Ideation & Prioritization

From meeting recap to honest closure - without another task manager

Design objective
Help commitment owners remember and close work, help managers prepare without monitoring individuals, and help dependent coworkers react to meaningful changes. The experience must extend existing Fireflies recaps, Notebook, Tasks, Home and Meeting Prep surfaces rather than create a separate destination.

1. Ideation Principles

- Use Fireflies' existing extraction, Tasks Feed, Slack and Microsoft Teams recap integrations, and Meeting Prep.
- Keep project-tool export selective; many customer, business and research commitments do not need Jira or Asana tickets.
- Keep interaction inside Fireflies: Slack and Teams provide the recap and deep link, while task updates happen in Fireflies.
- Use Fireflies push notifications for recall because users may not open Fireflies every day; do not depend on Slack or Teams direct messages.
- Treat done, reassigned and deliberately dropped as legitimate outcomes and distinguish deliberate drop from deletion of an incorrect task.
- Show managers meeting-level exceptions and outcomes without assignee names, completion rankings or individual performance scores.
- Notify dependent coworkers only when a commitment changes their ability to proceed.
- Do not invent an owner, due date, dependency, commitment type or status.

Existing-platform boundary

Fireflies already posts meeting recaps to Slack and Microsoft Teams, provides clickable links back to the full recap, creates tasks, and offers My Tasks, All Tasks and Meeting Prep. These are foundations, not proposed net-new solutions. Fireflies also documents two-way task syncing as an upcoming update; it is treated here as a roadmap dependency and is not scored as our solution.

2. Idea List

#	Idea	How it fits the existing flow
1	Adaptive recap structure	Change recap sections by meeting context: customer, stakeholder, business, sprint, planning or internal.
2	Meeting-to-task deep links	Make the commitment heading and each task title open the relevant Fireflies Tasks view or task detail.
3	Personalized Notebook commitments	After opening the recap, show the logged-in user's commitments from that meeting.
4	Source context in task detail	Preserve the complete task text, transcript excerpt, timestamp, meeting source and history.
5	Minimal due push notification	Send a permission-based Fireflies push notification such as 'Due tomorrow' that opens the task.
6	Bundled reminders	Combine several due commitments into one notification and limit reminder frequency.
7	Needs-clarification state	Prevent reminders until unclear wording or ownership is confirmed.
8	Review dates for non-ticket work	Use a review point for research, decisions, monitoring or ongoing commitments without a natural due date.
9	Deliberately drop	Add an explicit closure outcome with a short business reason; keep it separate from deleting an incorrect task.
10	Dependency impact update	Show affected coworkers when an upstream commitment is completed, delayed, reassigned or dropped.
11	Anonymous manager brief	Show open, closed, blocked and discussion-required commitment counts without assignee names.
12	Discussion-required Meeting Prep	Surface unresolved decisions and commitments that need attention before the next related meeting.
13	Inline chat action buttons	Allow completion from Slack or Teams; considered but deprioritized because support is inconsistent and actions should remain in Fireflies.

3. Prioritization

Rank	Idea	R	I	C	E	RICE
1	Commitment closure foundation	9	3	85%	4.0	5.74
2	Deliberately drop	7	3	85%	3.0	5.95
3	Role-aware commitment intelligence	7	3	75%	4.0	3.94

Rank	Idea	R	I	C	E	RICE
4	Needs-clarification state	4	2	75%	2.0	3.00

Rank	Idea	R	I	C	E	RICE
5	Adaptive recap structure	8	2	75%	4.0	3.00
6	Personalized Notebook commitments	7	2	75%	4.0	2.63
7	Source context in task detail	6	1	85%	2.0	2.55
8	Review dates for non-ticket work	5	2	75%	3.0	2.50
9	Bundled reminders	6	1	80%	2.0	2.40
10	Anonymous manager brief	5	2	70%	3.0	2.33

Rank	Idea	R	I	C	E	RICE
11	Discussion-required Meeting Prep	4	2	70%	3.0	1.87
12	Dependency impact update	4	2	60%	4.0	1.20
13	Inline chat action buttons	6	2	50%	5.0	1.20

Prioritization interpretation

The ideas cluster into two complementary layers. The Commitment Closure Foundation provides shared state, contextual deep links, restrained recall and legitimate closure. Role-Aware Commitment Intelligence then interprets collisions and dependency impact for owners, managers and dependent coworkers. Existing recaps and Meeting Prep remain distribution surfaces rather than being presented as new solutions.

4. Shortlisted Solution 1 - Commitment Closure Foundation

Turn every confirmed extracted commitment into a stateful object inside the existing Fireflies Tasks experience. It carries the confirmed owner, due or review date, source meeting, transcript context, dependency and history, then supports explicit done, reassigned and deliberately dropped outcomes.

Foundation element	Product rule
Ownership	Use the person who explicitly accepted; otherwise show Needs confirmation
Time	Carry an explicit due date or let the owner choose a review date
Context	Preserve source meeting, transcript timestamp and relevant discussion
Recall	Use one bundled, permission-based due notification that deep-links to Fireflies
Closure	Done, Reassigned or Deliberately dropped with a reason
Dependency	Update only confirmed coworkers whose work is affected

User flow

- Fireflies extracts a commitment using its existing capability and links it to the source meeting.
- An explicit owner is carried forward; ambiguous ownership pauses in Needs confirmation.

- The task appears in the existing My Tasks or All Tasks surface with due or review state.
- A minimal bundled notification brings the owner directly to the relevant task when attention is useful.
- The owner records Done, Reassigned or Deliberately dropped; non-closure states remain visibly unresolved.
- Manager and confirmed dependent views update from the same state without exposing unrelated activity.

Illustrative task
Complete CSV Export UAT testing - Owner: Meera - Due Friday - Status: Open
Dependency: Priya's customer demonstration

The task title opens this detail inside Fireflies. The owner can mark done, reassign or deliberately drop with a reason.

Why shortlisted

- Directly changes extracted commitments from information into trackable, honest state.
- Supports work that remains in Fireflies as well as selectively exported project-tool work.
- Gives all three personas one shared version of the commitment without a new destination.
- Preserves consent and avoids inventing missing owners, dates or dependencies.

5. Shortlisted Solution 2 - Role-Aware Commitment Intelligence

Use the existing Home, Tasks, Meeting Prep and AskFred surfaces to interpret confirmed commitment state differently for an owner, manager and dependent coworker. Core reports what is true; Team Intelligence recommends possible next actions but never executes them automatically.

Core versus Intelligence
Team Core: 'Friday may be overloaded: 3 commitments are due.'
Team Intelligence: 'UAT blocks Priya's customer demonstration; consider protecting focus time, reviewing the regression date, or adding this to the release discussion.'

Every recommendation requires a person to consider, confirm or dismiss it.

Role-specific value

- Owner - sees personal collisions and may consider focus time, date review or a discussion; no calendar change occurs automatically.
- Manager - sees business risk, dependency impact and items requiring discussion; no employee ranking or continuous monitoring.
- Dependent coworker - sees only upstream state affecting their own task and may consider alternative sequencing or a team discussion.

Automation boundaries

- Detect and explain collisions; do not automatically reprioritize or reschedule work.
- Suggest a focus slot only when enough calendar and duration context exists; an empty calendar is not proof of capacity.
- Require explicit or confirmed dependency before surfacing impact to another coworker.
- Use the existing AskFred panel for recommendations and Meeting Prep for team discussion.
- Keep notifications permission-based, bundled and frequency-capped.

Why shortlisted

- Addresses priority collisions, dependency uncertainty and manager preparation after basic visibility is established.
- Creates differentiated team value without redesigning pricing or building a separate analytics product.
- Supports decisions while preserving autonomy and protecting workers from surveillance dynamics.
- Uses existing Fireflies surfaces, reducing navigation and adoption cost.

6. Persona Coverage

Persona	Experience	Value
Commitment owner	Personal commitment view, deep-linked task context and lightweight recall	Can complete, reassign, deliberately drop, continue or request discussion
Manager	Adaptive meeting brief and name-free outcome/exception summary	Prepares for meetings without rankings or continuous individual monitoring
Dependent coworker	Only upstream commitments affecting their ability to proceed	Sees meaningful completion, delay, reassignment or drop impact

7. Trade-off Analysis

Trade-off	Optimizes for	Sacrifices	Product decision
Shared state vs lightweight product	Reliable closure	Pure broadcast simplicity	Add state inside existing Tasks rather than a new workspace
Accountability vs autonomy	Honest, visible outcomes	Private silent reprioritization	Allow legitimate drop/continue; no rankings or manager completion scores
Automation vs user control	Timely recall	Zero interruption	Permission-based minimal push, bundling, frequency caps and snooze
Visibility vs privacy	Manager and dependent awareness	Full anonymity	Name-free manager summary and relevance-based dependent access
Standard due dates vs real work	Measurable review points	One lifecycle for every task	Use review dates for research, decisions, monitoring and ongoing commitments

Worst-case tests and safeguards

Worst case	Safeguard
Push notifications become another noisy reminder system	Frequency caps, bundling, snooze and per-user permission controls
Users drop work to improve the metric	Track drop reasons, reopen rate and unusual patterns; never reward raw closure alone
AI treats an unclear statement as accepted work	Use Needs confirmation; do not notify or expose it as owned work yet
Manager view becomes surveillance	No names, rankings, individual completion rate or inactivity score in the summary
A dependent is incorrectly linked	Require explicit or user-confirmed dependency before surfacing impact
Client information reaches the wrong channel	Preserve privacy settings, integration routing rules and human-controlled sharing
Notification permission is disabled	Show the same due state on Home, Tasks, Notebook and Meeting Prep as a fallback

8. Proposed Product Direction

Commitment Closure Foundation with Role-Aware Intelligence

Use one shared commitment object across existing Fireflies surfaces. Team Core confirms ownership, preserves context, provides restrained recall and records honest closure. Team Intelligence interprets collisions and dependencies for owners, managers and dependent coworkers, but leaves assignment, scheduling and priority decisions to people.

Platform dependency and scope boundary

- Two-way project-tool synchronization is an announced Fireflies update and is not counted as our proposed solution.
- Until that capability is available, the proposed closure flow operates for commitments managed directly in Fireflies.
- The solution does not rebuild extraction, replace Jira or Asana, or require every commitment to become a ticket.
- Slack and Teams retain their existing role as recap and discovery surfaces; completion actions remain in Fireflies.

Step 3 conclusion

The recommended direction is one coherent commitment-follow-through system. The Foundation establishes truthful state and explicit closure; Role-Aware Intelligence turns that state into relevant decisions for the three team personas. Existing recaps, Tasks, Home, Meeting Prep and AskFred carry the experience, avoiding a new inbox, forced project-tool tickets and surveillance.

STEP 4

Design Experience, Mini PRD & Prototype

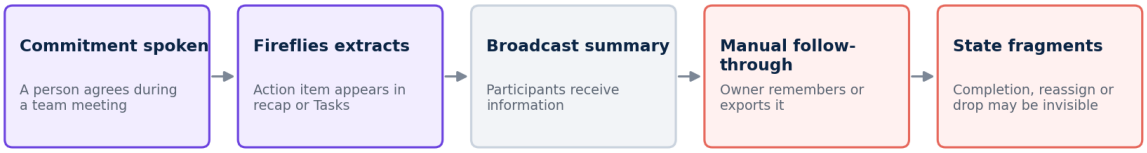

One shared commitment, three role-relevant experiences

Experience decision

Do not build a new commitment dashboard. Extend Home, Tasks, Meeting Prep, notifications and AskFred. The same commitment state powers the owner, manager and dependent-coworker views; permissions and meeting relationships determine what each person sees.

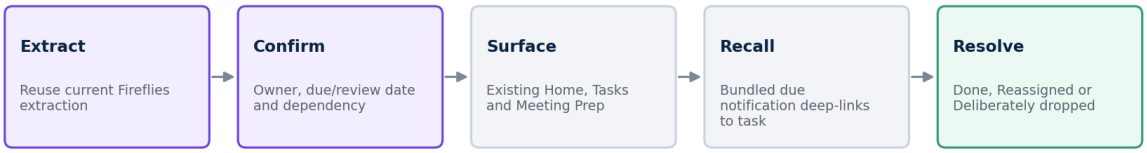

1. Before and After Experience

Current journey: commitment becomes information, then loses state

- The loss point is not extraction. It begins when the commitment has no durable, shared lifecycle after the recap.
- Manual export can lose execution metadata, while work completed elsewhere may never update Fireflies.
- Managers reconstruct status before meetings and dependent coworkers learn about changes late or informally.

Proposed journey: confirmed state moves toward honest closure

Detailed proposed flow

Stage	Experience	Guardrail
1. Meeting ends	Existing extraction identifies a possible commitment	No extraction-model change

Stage	Experience	Guardrail
2. Establish state	Use explicit owner/date; otherwise Needs confirmation or owner-selected review date	No invented assignment
3. Existing surfaces	Show in Tasks; link from recap/Notebook; surface relevant exceptions on Home or Meeting Prep	No new inbox
4. Recall	One bundled permission-based due notification opens the exact Fireflies task	No action in the notification

Stage	Experience	Guardrail
5. Person decides	Done, Reassign, Deliberately drop, Continue, Snooze or Needs discussion	Only first three resolve
6. Shared update	Manager summary and confirmed dependency state update from the same object	Relevance-based visibility

2. Mini PRD

Feature 1 - Commitment Closure Foundation

Problem and users
Extracted commitments are visible but lack a reliable shared lifecycle. Primary users are the commitment owner, a manager who needs meeting-level readiness, and a coworker whose work depends on the commitment.

Solution

Create a stateful commitment within the existing Fireflies Tasks model. Preserve confirmed ownership and meeting context, provide a due or review point, deep-link notifications into the task, and make honest closure explicit.

In scope	Requirement
Commitment detail	Title, confirmed owner, due/review date, source meeting, transcript timestamp, relevant context and history
States	Open, Needs confirmation, Waiting, Needs discussion, Done, Reassigned and Deliberately dropped

In scope	Requirement
Closure actions	Mark done; reassign with confirmation; deliberately drop with a required business reason
Recall	Permission-based, bundled due/overdue notification that opens the exact task in Fireflies
Dependency	Notify only a confirmed affected coworker when an upstream status materially changes

Out of scope

- Rebuilding extraction, transcription, recording or video-conferencing infrastructure.
- Replacing Jira, Asana, CRM or calendar products.
- Automatic assignment when a person did not explicitly agree.
- Pricing-plan redesign, enterprise security redesign or automatic project-tool synchronization delivery.

Feature-level success criteria

- Every surfaced owned commitment has a confirmed owner or an explicit Needs confirmation state.
- Every reminder opens the correct task with source context in one interaction.
- Done, Reassigned and Deliberately dropped are separately recorded and auditable.
- A drop requires a reason and updates confirmed dependents without automatically cancelling their work.

- Users can reopen a completed item; reopened and dropped items are not misreported as Done.

Feature 2 - Role-Aware Commitment Intelligence

Problem and users

Basic task visibility does not explain collision, business risk or dependency impact. Owners need help choosing the next move, managers need preparation without surveillance, and dependent coworkers need enough context to adapt their own work.

Persona	Existing surface	Intelligence behaviour
Owner	My Tasks plus collision signal	Suggest focus time, date review or team discussion; never change work automatically
Manager	All Tasks and existing Meeting Prep	Explain business risk and suggest agenda or sequencing discussions; no rankings
Dependent coworker	Own task plus confirmed Waiting on state	Explain impact and suggest next-step discussion or alternative sequencing

Intelligence requirements

- Core reports state: for example, 'Friday may be overloaded: 3 commitments are due.'
- Team Intelligence explains impact and offers Consider or Dismiss recommendations inside AskFred.
- The system never automatically reschedules, reprioritizes, assigns, reassigns, drops, calendar-blocks or alerts an assumed dependent.
- An empty calendar is not treated as proof of spare capacity; time suggestions require sufficient context and confirmation.
- Manager views are meeting- and business-outcome-oriented. Confirmed owner identity appears only after deliberate item inspection where coordination requires it.

3. Role-Aware Experience

Persona	Path	Primary action	Privacy boundary
Owner - Meera	Notification > My Tasks > task drawer	Review context; Done, Reassign or Deliberately drop	Personal workload only
Manager - Rahul	All Tasks > exception > Meeting Prep	Add business-risk item to release discussion	No names in list, rankings or activity scores
Dependent - Priya	My Tasks > Waiting on > context drawer	See Done/Reassigned/Dropped impact on own work	No unrelated owner tasks or calendar

Shared-state example

Meera deliberately drops CSV Export UAT because the business priority changed. Priya's customer-demonstration task changes from Waiting to Needs discussion and displays the reason; it is not automatically cancelled. Rahul sees one release dependency requiring discussion, then adds it to existing Meeting Prep. The same event is useful to all three personas without exposing Meera's unrelated activity.

4. Wireframe and Prototype Scope

Prototype surface	Required content and interaction
Home	Existing Personal Assistant cards, role-consistent greeting, Tasks collision signal, notification bell and AskFred panel
Tasks - owner	My Tasks, meeting group, clickable task titles, checkbox reopen, contextual drawer and three closure actions
Tasks - manager	All Tasks, name-free status/impact rows, clickable detail and Add to release discussion
Tasks - dependent	Own task plus Waiting on relationship and impact state; limited contextual drawer
Modals	Reassign confirmation and Deliberately drop with required reason
Team Intelligence	Existing AskFred panel with role-specific, recommendations-only collision guidance

Prototype status

A desktop concept is being built in Lovable against screenshots of the existing Fireflies Home and Tasks experience. The core Home, Tasks, drawer and closure interactions are partially working. Remaining work is to correct role labels and identity consistency, make every task title open the correct role-specific summary, synchronize cross-persona state and add the AskFred intelligence layer. Interactive prototype link: [insert final Lovable link].

5. Design Rationale

Decision	Rationale
Extend, do not relocate	Commitments stay in Home, Tasks, Meeting Prep, Notebook links and AskFred; users do not maintain another destination.

Decision	Rationale
One object, three views	A shared commitment state prevents owners, managers and dependents from seeing contradictory outcomes.
Ownership requires consent	A mention is not acceptance. Unclear ownership remains Needs confirmation and receives no reminder.
Notification opens context	The nudge says only what needs attention and opens Fireflies; it does not pressure a closure action outside the product.
Honest closure	Done, Reassigned and Deliberately dropped remain distinct; Continue, Waiting, Snooze and Needs discussion remain unresolved.

Decision	Rationale
Core records; Intelligence recommends	Collision and impact suggestions support judgment but never make scheduling or priority decisions.
Visibility without surveillance	Managers see meeting/business exceptions, not individual rankings or continuous activity.
Relevance protects privacy	Dependents see only confirmed upstream state that changes their own work.

6. Worst-Case Design Tests

Worst case	Design response
The extractor assigns a person who never agreed	Needs confirmation; no reminder, manager attribution or dependency notification until confirmed
Three reminders create pressure rather than help	Bundle them into one due notification; frequency cap and personal controls
Dropping becomes a way to game 45%	Required reason, separate reporting, reopen rate and unusual-drop guardrail
A manager uses the view to judge employees	No ranking, individual score, inactivity indicator or broad calendar exposure
A dependent assumes their work is cancelled	Dropped dependency changes their task to Needs discussion, never auto-cancelled
Calendar suggestions create false capacity	Show recommendation and evidence only; require human confirmation
Project-tool and Fireflies states conflict	Show sync source/history and conflict state when documented two-way sync becomes available
Notification permission is disabled	Repeat the same status on Home, Tasks and Meeting Prep without increasing message frequency

7. Acceptance Criteria

- Owner: notification opens the correct task; task can be marked done, reopened, reassigned or deliberately dropped with a reason.
- Manager: All Tasks summarizes meeting-level risk without names; opening one item reveals only the context needed for coordination and can add it to Meeting Prep.
- Dependent: confirmed upstream status updates their Waiting state without revealing unrelated owner activity.
- Shared state: one owner action produces consistent status across all three role views.
- Intelligence: recommendations explain why they appeared and provide Consider or Dismiss; no recommendation executes automatically.
- Integration: the prototype preserves Fireflies' recognizable shell and uses no new permanent navigation destination.

Step 4 conclusion

The designed experience closes the gap between extraction and explicit outcome through a stateful commitment inside existing Fireflies surfaces. The Foundation supplies ownership, context, recall and honest closure. Role-Aware Intelligence then helps the team interpret collision and dependency impact while preserving autonomy, privacy and human decision-making.

STEP 5

Adoption, Growth Loop & Business Impact

Manager-led activation, team-wide habit and measurable buyer value

Go-to-market decision

Launch the Team Core experience first and use managers as adoption champions because they convene recurring meetings and feel the cost of manual follow-up. Owners and dependent coworkers create the daily behaviour. After Core demonstrates value, Team Intelligence becomes an expansion capability within appropriate existing paid packaging. No new price, plan or pricing redesign is proposed.

1. Launch Plan

Initial cohort

Start with cross-functional product-release teams that already record recurring meetings in Fireflies and contain all three personas: a product manager or team lead, developers or QA who own commitments, and Customer Success, Sales or another function dependent on release outcomes.

Cohort member	Selection signal	Why included
Manager champion	Runs recurring planning, release or stakeholder meetings	Can enable the workflow and use commitment exceptions in Meeting Prep
Commitment owners	Developers, QA and functional contributors	Can validate whether closure actions reduce forgotten or ambiguous work
Dependent coworkers	Customer Success, Sales or adjacent delivery teams	Can validate whether confirmed status reduces blocker uncertainty
Administrator/buyer	Workspace owner or operating leader	Can compare adoption, meeting value and expansion potential

Why managers are the entry point

- They experience the repeated cost of reconstructing open decisions, blockers and commitments before meetings.
- They can introduce the Core workflow across a recurring team meeting rather than relying on isolated user discovery.
- They can demonstrate meeting-readiness value to administrators and buyers.
- They must be positioned as meeting facilitators, not monitors: the launch message is 'reduce follow-up and make the next meeting easier,' not 'track employee output.'

Capability sequence

Phase	Capability	Purpose
Phase 1 - Team Core	Confirmed ownership, due/review state, source context, restrained notification, Done, Reassign, Deliberately drop, dependency update and manager exception view	Create truthful closure behaviour and prove the 28% to 45% outcome

Phase	Capability	Purpose
Phase 2 - Team Intelligence	Collision explanations, business-impact interpretation, sequencing/focus suggestions, recurring-pattern detection and role-specific AskFred guidance	Provide expansion value after reliable Core state exists

Packaging boundary

The case recommends sequencing and value differentiation, not a new pricing structure. Exact plan placement, price points and packaging changes require separate commercial research and are outside scope. Team Intelligence may be mapped to suitable existing paid packaging only after Core effectiveness and demand are validated.

First-weeks adoption playbook

Timing	In-product adoption action	Behavioural signal
Week 0	Manager chooses one recurring meeting and reviews privacy/reminder controls	Eligible meeting configured
Week 1	Inline explanation introduces owner confirmation and three legitimate closure outcomes	First confirmed commitments
Week 2	Owners receive restrained deep-linked nudges; manager uses exceptions in Meeting Prep	First 7-day closures and discussions
Week 3	Dependents see only confirmed changes affecting their own work	Dependency acknowledgements
Week 4	Manager reviews team-level value and decides whether to include another recurring meeting	Second-meeting activation

2. Adoption Path

Bottom-up growth begins with one owner inside a team meeting, not with solo task management. A single honest update becomes useful to the manager and a confirmed dependent, which encourages them to use the same behaviour on future commitments.

Illustrative adoption journey

3. Rahul enables Team Core for the weekly CSV Export Release Planning meeting.
4. Meera explicitly closes or deliberately drops the UAT commitment in Fireflies.
5. Priya sees whether her customer demonstration is ready or needs discussion.
6. Rahul's next Meeting Prep reflects the current release risk without reconstructing status manually.
7. Priya and Rahul begin confirming and closing their own meeting commitments, and Rahul includes another recurring team meeting.

3. Growth and Behaviour Loop

Loop mechanism

The reinforcing reward is a better next meeting: less uncertainty, less manual follow-up and more accurate preparation. Notifications merely return attention to the task; they are not the growth engine. The loop fails if ownership is wrong, closure is pressured or manager value depends on individual surveillance.

4. Team Expansion Model

Expansion stage	Observable behaviour	Value created
1. Owner activation	Confirms and closes a commitment	Personal clarity and truthful state
2. Workflow activation	Returns through task deep link and uses context	Lower recall and search effort
3. Team activation	Manager and dependent act on relevant updates	Lower coordination uncertainty
4. Meeting expansion	Manager enables another recurring meeting	Repeatable team habit
5. Workspace expansion	Administrator enables additional teams	Consistent rhythm and value across functions
6. Intelligence expansion	Eligible teams adopt advanced recommendations	Higher-value planning and decision support

Expansion triggers

- Show a manager a team-level value summary only after enough commitments have reached an observable outcome.
- Recommend adding another meeting when Core is repeatedly used, not immediately after first activation.
- Introduce Team Intelligence when collision or dependency patterns are frequent enough to make recommendations useful.
- Let administrators compare meeting-level adoption and coordination outcomes; do not expose employee league tables.

5. Business Impact Model

Resolution opportunity

For every 1,000 eligible extracted commitments, the current 28% rate represents 280 explicit resolutions. A 45% rate represents 450, producing 170 additional observable closures per 1,000 commitments within 14 days. These may be Done, Reassigned or Deliberately dropped; they must not all be reported as newly completed work.

Impact component	Model	Interpretation
Additional explicit resolutions	Eligible commitments x (45% - 28%)	170 per 1,000
Potential follow-up time avoided	Additional resolutions x minutes of follow-up avoided	Scenario only; validate through study
Dependency delay avoided	Confirmed dependent tasks unblocked earlier x delay value	Measure by workflow and team type
Retention relationship	Compare retained teams with and without Core adoption	Association first; causal experiment preferred
Paid conversion relationship	Compare eligible free/trial teams exposed to value versus control	Do not attribute without experiment

Impact component	Model	Interpretation
Expansion relationship	Meetings, active members or teams added after demonstrated value	Use existing packaging; no new price assumed

Buyer-facing value

Value dimension	What the payer can observe
Execution visibility	More commitments reach an explicit, explainable outcome
Meeting efficiency	Less time reconstructing status and repeating unresolved commitments
Coordination	Confirmed dependent workers learn about meaningful change sooner
Adoption	More recurring meetings and team members use Fireflies beyond transcription
Expansion	Team Intelligence offers advanced planning value after Core habit is proven

Commercial measurement

- Retention: compare 30-, 60- and 90-day workspace retention by Core activation and sustained closure behaviour.
- Conversion: run a controlled test on whether demonstrated team value increases conversion to suitable existing paid plans.
- Expansion: measure additional active meeting series, activated members and teams after manager value is shown.
- Do not claim causality from correlated high-performing teams; use randomized or phased exposure where feasible.

6. Cohort Rollout Plan

Timing	Stage	Cohort	Decision evidence
Weeks 1-2	Internal dogfood and instrument validation	Fireflies internal cross-functional teams	Events accurate; no identity/privacy defect

Timing	Stage	Cohort	Decision evidence
Weeks 3-6	Core pilot	Opt-in product-release teams with recurring meetings	Owner confirmation, closure and reminder quality
Weeks 7-10	Controlled Core experiment	Eligible teams split into treatment/control	Resolution lift with guardrails intact
Weeks 11-16	Core cohort expansion	Customer Success, Sales and business teams	Value generalizes beyond engineering
Weeks 17-20	Team Intelligence pilot	Core-active teams with repeated collisions/dependencies	Recommendations considered and useful
Weeks 21-24	Workspace expansion decision	Administrators and buyers	45% trajectory plus adoption and safety gates

Rollout gates

Decision	Condition
Proceed	14-day resolution improves; ownership accuracy, notification opt-out, drop mix and user trust remain acceptable
Iterate	Use increases but resolution does not, or manager/dependent value is unclear
Pause	Wrong ownership, privacy leakage, surveillance behaviour, notification fatigue or metric gaming appears

7. Worst-Case Adoption and Business Tests

Worst case	Mitigation and evidence
Managers pressure owners to clear work	Position around meeting readiness; no employee scores; monitor trust and coercion feedback
Resolution rises mainly through dropping	Report outcome mix, drop reasons and reopen rate; do not reward raw closure alone
Core becomes another ignored backlog	Keep adoption inside existing Tasks, Home, Meeting Prep and deep-linked notifications
Notification fatigue suppresses usage	Bundling, frequency caps, permission controls and notification opt-out guardrail
Manager-led rollout feels top-down	Make owner and dependent benefits visible immediately; allow personal controls

Worst case	Mitigation and evidence
Intelligence upgrade appears before value	Offer only after Core state is reliable and repeated collision/dependency need is observed
Retention correlation is mistaken for causation	Use controlled/phased experiments and pre-period comparisons
Engineering pilot does not generalize	Expand to customer, sales and business cohorts before broad launch

Worst case	Mitigation and evidence
Step 5 conclusion Managers initiate adoption because they own meeting quality, but owners and dependent coworkers generate the recurring behaviour. Team Core must first prove truthful closure and reduced coordination effort. Team Intelligence then creates an evidence-based expansion path through existing paid packaging, while rollout gates protect autonomy, trust and measurement integrity.	

STEP 6

Metrics and Success Measurement

Success means more valid commitments reach an honest, observable outcome within 14 days. The measurement system therefore combines one outcome metric with early behavioural signals, business value indicators and safeguards against gaming, overload and surveillance.

1. North Star Metric

14-Day Honest Commitment Resolution Rate

The percentage of unique, valid commitments extracted from eligible team meetings that are explicitly marked Done, accepted by a new owner through Reassignment, or Deliberately Dropped with a recorded reason within 14 days of creation.

Element	Definition
Formula	Eligible commitments honestly resolved within 14 days / all unique valid commitments extracted from eligible team meetings x 100
Baseline	28%
Six-month target	45%
Counts as resolved	Done; Reassignment accepted by the new owner; Deliberately Dropped with a recorded reason
Does not count	Open, Waiting, Needs discussion, pending or rejected reassignment, snoozed, repeated, silently ignored, or Done and reopened before measurement

The denominator includes unresolved commitments so the result cannot be inflated by measuring only active owners or commitments users chose to open. Duplicate or invalid extractions may be excluded only through an explicit, auditable invalidation event. A unique root commitment ID prevents a reassigned commitment from being counted twice.

2. Leading Metrics

Leading metrics measure early behaviours that should precede honest closure. They diagnose whether the Core experience is establishing ownership and prompting useful action.

Metric	Calculation	Purpose
24-hour meaningful action rate	Commitments receiving a meaningful owner action within 24 hours / valid commitments created	Primary early indicator
Ownership coverage within 24 hours	Commitments with confirmed or explicitly clarified ownership within 24 hours / valid commitments created	Tests ownership clarity

Metric	Calculation	Purpose
Execution-ready commitment rate	Commitments with a confirmed owner and due date or review date / valid commitments created	Tests actionability

Metric	Calculation	Purpose
Due-soon nudge response rate	Due-soon notifications followed by a task open or meaningful update / due-soon notifications delivered	Tests reminder usefulness
Reassignment response rate	Reassignment requests accepted, rejected or moved to Need meeting within 24 hours / requests delivered	Tests consent flow

A meaningful action includes confirming or clarifying ownership, adding or changing a due or review date, changing status, requesting discussion, initiating or responding to reassignment, marking Done, or Deliberately Dropping. Merely viewing a commitment does not qualify.

3. Lagging Metrics

Lagging metrics measure the eventual result after users have had time to act. The primary lagging measure is the North Star; the remaining measures explain the quality and composition of that result.

Metric	Definition	What it reveals
14-day honest resolution rate	Share resolved legitimately within 14 days	Final product outcome
Resolution outcome mix	Share resolved as Done, accepted Reassignment or Deliberately Dropped	Detects closure gaming
Median time to resolution	Median elapsed time from extraction to legitimate resolution	Shows resolution speed
14-day silent-ignore rate	Commitments with no legitimate resolution after 14 days / valid commitments	Measures the original failure mode
Reopen rate	Done commitments reopened within seven days / commitments marked Done	Tests whether Done was genuine
Repeat closure rate	Owners who honestly resolve commitments across at least two eligible meeting cycles / returning owners	Tests durable behaviour

4. Business and Expansion Metrics

Metric	Definition
Core activation	Eligible teams that confirm or meaningfully act on at least one commitment within seven days of exposure
Recurring team adoption	Meeting series using commitment actions in at least three separate weeks
Activated members	Unique team members who meaningfully act on a commitment, not merely view a recap

Metric	Definition
Retention	30-, 60- and 90-day workspace retention by Core activation and sustained closure cohort
Paid conversion	Conversion to suitable existing paid plans among exposed versus comparable unexposed workspaces

Metric	Definition
Workspace expansion	Growth in activated members, recurring meeting series and participating teams after Core adoption
Intelligence adoption	Eligible Core-active teams that view and act on a collision, dependency or scheduling recommendation
Perceived buyer value	Share of buyers or administrators reporting lower follow-up effort and better meeting readiness

Retention, conversion and expansion must be evaluated through controlled or phased exposure where feasible. Correlation between high-performing teams and product use is not sufficient evidence of causation.

5. Guardrail Metrics

Guardrail	Measures monitored
Commitment quality	Invalid extraction rate, duplicate rate and wrong-owner correction rate
Consent	Reassignment rejection rate, unresolved pending requests and unauthorized ownership changes
Honest closure	Drop-rate spike, low-quality drop reasons, repeated reassignment and reopen rate
Notification health	Notifications per active owner per week, dismissal rate, mute or opt-out rate and complaint rate
Trust and surveillance	Reports of manager pressure, unauthorized views, individual rankings or use of data for performance scoring
Recommendation safety	Intelligence suggestions dismissed as irrelevant and unauthorized automatic schedule or priority changes

6. Event Tracking Specification

Event	Required properties	Measurement use
meeting_processed	meeting_id, workspace_id, meeting_type, occurred_at	Defines eligible meeting cohort
commitment_extracted	commitment_id, root_commitment_id, meeting_id, created_at	Creates denominator candidate
commitment_validated or invalidated	commitment_id, reason, actor_type, timestamp	Controls valid denominator
ownership_confirmed or clarified	commitment_id, owner_id, method, timestamp	Measures ownership coverage
commitment_updated	commitment_id, field_changed, old_value, new_value, actor_id, timestamp	Measures meaningful action

Event	Required properties	Measurement use
notification_sent or opened	commitment_id, recipient_id, notification_type, channel, timestamp	Measures nudge delivery and response

Event	Required properties	Measurement use
reassignment_requested	commitment_id, from_owner_id, proposed_owner_id, timestamp	Starts consent flow
reassignment_responded	commitment_id, response, responder_id, timestamp	Accept, Reject or Need meeting
commitment_resolved	commitment_id, resolution_type, actor_id, reason_if_dropped, timestamp	Creates North Star numerator
commitment_reopened	commitment_id, actor_id, timestamp	Removes false closure where applicable
manager_filter_applied	meeting_id, filter_type, actor_id, timestamp	Measures coordination use
intelligence_recommendation_acted	recommendation_id, type, action, actor_id, timestamp	Measures advanced-feature value

7. Measurement Cadence and Decision Rule

- Monitor leading metrics weekly so ownership, actionability and nudge problems are detected before the 14-day outcome matures.
- Review the North Star and lagging metrics on rolling 14-day cohorts, segmented by team type, workspace size, meeting type and new versus returning teams.
- Review business metrics monthly and at 30-, 60- and 90-day retention checkpoints.
- Ship broadly only if the resolution rate is on a credible path from 28% to 45% and quality, consent, notification and trust guardrails remain acceptable.

STEP 7

Risks, Trade-offs and Constraints

What could make the strategy fail and where the product must stop

The strategy succeeds only if Fireflies remains a meeting-to-commitment coordination layer. It should preserve ownership, context and honest closure while leaving detailed delivery planning to Jira, Asana and similar systems.

1. Risk Assessment and Mitigations

Risk	Severity	Worst case	Mitigation
Two-way sync reduces the need for the Closure Foundation	High	Teams that manage every extracted item in Jira or Asana may receive little value from a parallel Fireflies state.	Treat the external task as the delivery record. Fireflies retains meeting context, consent-based reassignment, non-ticket commitments, dependencies and deliberate-drop reasons without duplicating project fields.

Risk	Severity	Worst case	Mitigation
Incorrect commitment or owner	High	A false extraction or misattributed owner creates unwanted work and damages trust.	Require correction and invalidation controls; distinguish explicit verbal acceptance from ambiguous mentions; monitor wrong-owner and invalid-extraction rates.
Reassignment without real consent	High	A manager or colleague can shift responsibility to someone who never agreed.	Keep the original owner responsible until the proposed owner selects Accept. Reject and Need meeting remain legitimate responses.
Closure becomes performative	High	Users mark work Done or Dropped merely to clear reminders or satisfy a manager.	Track outcome mix, drop reasons, reopen rate and repeated reassignment; never reward raw closure counts or rank individuals.
Notification fatigue	High	Frequent low-value reminders are muted and the feature becomes another ignored inbox.	Notify only the relevant owner, bundle alerts, cap frequency, provide controls and measure dismissals, mutes and opt-outs.
Manager visibility becomes surveillance	High	Managers use commitment data to compare people rather than coordinate work.	No employee rankings, productivity scores or teammate-performance filters. Limit views to authorized meetings, dependencies and business outcomes.
Offline meetings are not captured	Medium	Fireflies cannot extract or follow commitments from an unrecorded conversation.	Support recorded or uploaded meetings only. Do not create a major manual-entry workflow that turns Fireflies into a task manager.
Team Intelligence is irrelevant to some users	Medium	Individual plans and low-meeting teams may have insufficient shared commitments or schedule collisions.	Surface Intelligence only to eligible team workspaces with adequate meeting, commitment and calendar signals.
Suggestions are wrong or intrusive	Medium	Calendar or dependency context may be incomplete, creating poor scheduling advice.	Label recommendations as suggestions; show the evidence used; never automatically reschedule, reprioritize, reassign or drop work.

Risk	Severity	Worst case	Mitigation
External status becomes stale	Medium	Integration failure causes Fireflies and the work system to show conflicting states.	Show sync health and last-updated time, retry safely, and avoid claiming resolution when the source state is uncertain.

2. Trade-off Analysis

Tension	We optimize for	We consciously sacrifice	Reason
Accountability vs autonomy	Confirmed ownership and explicit outcomes	Automatic assignment or manager-enforced closure	Consent protects trust even if confirmation adds friction.
Visibility vs privacy	Meeting- and dependency-relevant coordination	Employee-level performance monitoring	Managers receive enough context to unblock work without a surveillance dashboard.
Automation vs user control	Contextual reminders and explainable recommendations	Automatic reprioritization, reassignment or calendar changes	The system assists decisions but does not make commitments on a person's behalf.

Tension	We optimize for	We consciously sacrifice	Reason
Coverage vs product focus	Commitments extracted from captured team meetings	Uncaptured offline work and general task entry	A narrower scope prevents Fireflies from becoming another project-management tool.
Fireflies state vs external source of truth	Meeting context and honest closure coordination	Duplicating full ticket execution data	Connected work tools remain responsible for detailed delivery management.
Broad availability vs relevant monetization	Core closure for eligible team users; Intelligence for signal-rich teams	Showing advanced scheduling intelligence to individual or low-activity plans	Eligibility protects relevance and reduces confusing upgrade prompts.

3. Constraints and Assumptions

Constraint or assumption	Implication for the first version
Existing extraction	Commitments are supplied by Fireflies' current extraction capability; extraction-model improvement is out of scope.
Eligible setting	The primary problem concerns captured team meetings, not standalone personal task management.
Integrations	Reliable external status depends on supported APIs, permissions, field mapping, rate limits and the availability of two-way sync.
Calendar intelligence	Schedule suggestions require permissioned calendar availability and sufficient commitment dates; private event content is not required.
Identity and access	Owners, managers and dependent coworkers must be resolved through workspace membership and meeting authorization.

Constraint or assumption	Implication for the first version
Offline meetings	Only recorded or uploaded offline meetings can enter the automated commitment lifecycle.
Closure semantics	Done, accepted Reassignment and Deliberately Dropped are legitimate outcomes; pending reassignment and repeated discussion are not.
Human authority	Fireflies may recommend an action but cannot accept ownership, change priority or alter a schedule on a user's behalf.

4. What We Will Not Build

The following boundaries are explicit. Their absence is a product decision, not unfinished scope.

Excluded capability	Why it is excluded
Ticket sizing, story points or effort estimation	Belongs in project planning tools
Manager filtering by teammate for performance review	Creates a surveillance dynamic rather than coordination value
Conversation threads under every commitment	Creates another communication inbox; existing channels remain the discussion surface

Excluded capability	Why it is excluded
Release or sprint management	Fireflies may preserve meeting context but will not run releases, backlogs or sprint ceremonies
Kanban boards, task hierarchies and workflow builders	Would duplicate project-management products
Time tracking, attendance scoring or productivity rankings	Not required for honest closure and harmful to trust
Automatic assignment, reprioritization or rescheduling	A person must retain authority over ownership and workload
A broad manual task-entry system	The experience begins with commitments extracted from captured meetings

5. Failure Tests and Decision Rules

Failure test	Evidence	Decision
Feature 1 is dead after two-way sync	Most closure activity occurs exclusively in connected tools and Fireflies adds no measurable context, consent or non-ticket value	Narrow Feature 1 to the coordination layer; remove duplicated external-task controls.
Feature 2 lacks an eligible audience	Few team workspaces have repeated collisions, dependencies or usable calendar signals	Do not scale or promote Intelligence until eligibility and usefulness thresholds are met.
Managers adopt but owners disengage	Manager views rise while owner action falls, notification opt-out rises or trust feedback worsens	Pause expansion; reduce manager surfaces and redesign owner control.

Failure test	Evidence	Decision
Resolution rises for the wrong reason	The increase is dominated by drops, immediate Done actions followed by reopening, or repeated reassignment	Treat the experiment as failed despite North Star movement and correct the incentive design.
Fireflies becomes another backlog	Users must repeatedly visit Fireflies to manually maintain fields already managed elsewhere	Reduce duplicate state, rely on deep links and sync, and keep only meeting-specific coordination data.

Final decision: launch the Closure Foundation only where it adds meeting-specific ownership, context or honest-closure value beyond two-way sync. Offer Commitment Intelligence only to eligible team workspaces. If either condition is not demonstrated, narrow or stop the feature rather than add more workflow.
